

**COSC3106 Python Programming Studio / Milestone 1: Design ‘RoadInsight
Victoria’**

Aisha Kaur s4000375 (Student A)

Muhammad Tayyab Atif s4226244 (Student B)

RMIT University

19/05/2025

1. Conduct Secondary User Research

Secondary user research was conducted to better understand which groups would benefit from a road incident data website and what type of information they would need when analysing road safety issues in Victoria. The research focused on Victorian road safety strategies, public crash datasets and local government road safety responsibilities.

Based on the research findings, two key user groups were identified for the website:

- local council road safety officers
- road trauma and emergency response planners

Aisha's research: Local council road safety officers

Secondary user research was conducted to better understand how local council road safety officers could benefit from a road incident data website. This user group was selected because local councils help improve road safety by identifying dangerous road conditions, planning infrastructure improvements, and supporting community safety decisions.

The Victorian Road Safety Strategy 2021 to 2030 explains that road trauma continues to be a major issue across Victoria and highlights the importance of evidence based planning and safer infrastructure [1]. This is relevant to local council road safety officers because their work often involves using crash information to support road maintenance, signage, street lighting and other safety improvements.

The Victorian road crash dataset provided by the Department of Transport and Planning includes information about crash locations, weather conditions, road surface conditions and road users involved in crashes across Victoria [2]. This showed that a website could help road safety officers explore conditions that may affect road incidents, especially environmental conditions such as wet roads, poor lighting, and weather.

Austroads research found that reducing crash risks on local roads requires a clear understanding of the types of crashes occurring within local areas [3]. Further Austroads research also identified that roads managed by local councils can experience higher casualty crash risks compared with major state managed roads [4]. These findings support the selection of local council road safety officers as a key user group because they need access to clear crash summaries to help identify high risk conditions and support road safety planning.

From the research, the main goals of local council road safety officers are to identify crash patterns, understand conditions linked to higher crash rates, support infrastructure decisions and reduce crashes in high risk areas. Their main needs include quick access to summarised crash information, filtering tools for road surface, weather and lighting conditions, and visual comparisons that are easy to understand.

A key challenge for this user group is that crash datasets can be large and time consuming to analyse. Existing crash reporting systems may also feel technical or difficult to navigate, especially when users need to compare multiple crash conditions at once. These findings influenced the design of RoadInsight Victoria by encouraging the use of filters, summary cards, charts, and progressive disclosure to make crash data easier to explore and understand. Overall, the research showed that local council road safety officers would benefit from a website that simplifies crash analysis and presents environmental crash information in a clearer and more visual way.

Tayyab's research: Road trauma and emergency response planners

Secondary User Research: RoadInsight Victoria (Student B)

Introduction

Our team is looking into the "RoadInsight Victoria" project. This initiative aims to help Victorians better understand road safety data. We want to create a website that makes this information easy to access for everyone who wants to help improve road safety. This research report examines who these users are, what they need, and the challenges they face when searching for reliable data.

Research Findings: The Current Landscape

After reviewing various government websites, safety strategy papers, and community reports, we noticed a common issue: while Victoria has a lot of crash data, it is not always user-friendly. The Department of Transport and Planning and the TAC offer high-level statistics that are crucial for long-term planning. However, these are not always easy for everyday people to understand. We found a significant gap here. The data is often presented in complex formats that require advanced skills to interpret. For a local resident or community advocate, this poses a major challenge. They seek specific, relevant insights for example, identifying issues at a dangerous intersection near their home but instead face large, state-wide datasets that take too long to sift through. Our findings indicate that to support the "Safe System" approach, we must connect complex raw data with the people who can actually use those insights to enact local changes.

people who can actually use those insights to enact local changes.

Key User Groups

1. Road Safety Researchers and trauma analyst.

This group operates on a more institutional level, focusing on the overall picture of road safety. We identified their needs through parliamentary inquiries and government strategy papers. They require access to detailed, historical trends that span several years. Their goal is To establish a solid evidence base that supports large-scale government funding for infrastructure or policy changes.

Pain point: Their main challenge is fragmentation. They often need to navigate multiple agency portals to gather the necessary information for a complete report. They require a single, cohesive view of crash factors, but the current system makes this process more manual and time-consuming than it should be.

Summary :

To support a safe system in Victoria and aiming to achieve the goal of zero deaths, data must be democratized. Therefore, our application provides a bridge to this application by fixing the gap, through translating complex raw data into user-centric visualizations, which will empower both residents and strategic planners to make informed safety decisions.

Persona 1: Local Council Road Safety Officer (Student A)

Maya Thompson

Age: 38

Occupation: Local Council Road Safety Officer

Location: Victoria, Australia

Education: Bachelor of Urban Planning

Work Environment: Local government office and field-based road safety inspections

BACKGROUND

Maya works for a local council in Victoria and is responsible for improving road safety within her municipality. Her role involves reviewing road incident data, identifying high risk areas, and supporting decisions related to road maintenance, signage, street lighting and community safety programs. She regularly works with transport planners, engineers, and local government teams to reduce crash risks and improve public safety.

GOALS

- Identify environmental conditions linked to higher crash rates
- Improve road safety planning and infrastructure decisions
- Support funding requests using crash data evidence
- Reduce crashes in high risk areas
- Quickly compare crash patterns across different conditions

NEEDS

- Easy access to summarised crash information
- Filtering options for weather, road surface and lighting conditions
- Visual charts and comparisons that are easy to understand
- Fast access to important crash trends without analysing raw data manually
- Clear insights that support road safety decision making

SKILLS AND EXPERIENCE

- Strong understanding of local road safety planning
- Experience using council reporting systems and spreadsheets
- Basic experience interpreting crash statistics and trends
- Familiar with transport and infrastructure planning processes
- Moderate technical skills with dashboards and reports

TECHNOLOGY USAGE

- Uses spreadsheets to review crash reports and council data
- Uses council reporting systems regularly
- Uses dashboard tools to monitor road safety trends

WHY THIS PERSONA IS IMPORTANT

Maya represents an important user group because local council road safety officers regularly use crash data to support road safety planning and infrastructure decisions within their communities. The secondary user research identified that council road safety officers regularly rely on crash data to support infrastructure planning, identify dangerous road conditions, and improve public safety outcomes. However, existing systems can often be difficult to navigate and require users to manually analyse large amounts of crash information.

RoadInsight Victoria was designed to support users like Maya by providing clearer crash summaries, filtering tools and visual comparisons that make environmental crash data easier to explore and understand. The Level 2 and Level 3 pages directly support Maya's goals by helping her investigate crash patterns linked to road surface, weather, and lighting conditions.

PERSONA IMAGE REFERENCE

Persona image generated using OpenAI DALL·E via ChatGPT for educational purposes [7]. The image represents a fictional local council road safety officer and is not based on a real person.

Level 1: Landing Page (Student A)

PURPOSE

The landing page introduces users to RoadInsight Victoria and provides a simple overview of road incident data across Victoria. The page is designed to capture user's attention, present key crash insights and guide users towards exploring environmental crash conditions in more detail.

Wireframe Diagram of Level 1 Landing Page

USER GOALS

- Quickly understand the purpose of the website.
- View important crash statistics.
- Navigate towards deeper crash analysis pages.

DATABASE FEATURES

- Retrieving crash summaries from the database tables.
- Displaying simple statistics from crash data.
- Presenting information from a single table query.

NIELSEN HEURISTICS [5]

- Visibility of system status through summary statistics.
- Recognition rather than recall using clear navigation labels.
- Consistency and standards through repeated navigation layout.
- Aesthetic and minimalist design using simple cards and headings.

DESIGN PATTERNS

- Card layout pattern for summary statistics.
- Navigation menu pattern for moving between pages.
- Dashboard pattern for presenting crash summaries.

HOW THE DESIGN SUPPORTS THE PERSONA

The landing page supports Maya Thompson by providing quick access to important crash information without overwhelming users with technical details. The page introduces environmental crash analysis in a simple and organised way before users move into deeper analysis pages.

Level 1: Mission Statement (Student B)

1) Title and intro

Title: Road Insight Victoria

Preventing Road Incidents – Mission

Our web application is designed in such a way that it will support road safety in Victoria, allowing people to explore the official road crash data in a clear and unbiased way. Further, our aim is to make complex crash info easier so that different users can easily understand it and identify patterns, allowing them to make more informed decisions about road safety.

2) Mission and purpose

Our Mission:

The mission of this website is to provide a data-driven view of road crashes in Victoria in a respectful way. Therefore, by using validated data from the Department of Transport and Planning, this website mainly focuses on showing when, where, and how crashes occur, and which groups of road users are most affected, helping us to reduce future accidents. **(Department of Transport and Planning 2026)**

3) How The Site Could Be Used;

On this website:

- User can View summaries of road crashes over time and across different areas at a high level.
- They can explore crashes by different factors, such as including crash type, road user type, and severity.
- These users can also compare patterns to identify times, locations, or conditions where crashes are more common.
- By using this information, users can start pointing for further research, planning, or safety education.

4) Personas (from database)

Who This Site Is For

This website has been designed using a user-centred approach. The focus represents specific users' needs, which are represented as personas. Following the personas stored in the database and shown dynamically.

Persona:

Name: Dr Sarah Chen

Age: 45

Role: "A Trauma Research Analyst"

Background: Dr. Sarah Chen is a trauma research analyst; she specialises in road incident psychology. Her background education is in clinical psychology and accident-related trauma, which helps her to study how car crashes affect cognitive functioning, stress responses, and long-term recovery. She further uses data from

real-world collision patterns to identify risk factors and develop evidence-based strategies that improve road-safety interventions and prevent future accidents.

Goals:

- To use data to use data for identifying high risk pattern and pinpoint specific accident conditions, such as weather or lighting, which lead to severe head or spinal injuries.
- Analysing safety features such as side impact airbags or seatbelts which reduce the severity of injuries or not in real-world Victorian crashes.
- To improve the post-crash care, therefore, by providing data to emergency services will allow them to understand which type of collision requires more attention, care, and treatment.

Needs:

- Need access to data for correlation of data between safety and equipment usage. (seatbelt, helmets) etc, and fatality rates to identify the trends of survival.
- To determine how the vehicle structure has impacted passengers' safety in a high-speed collision.
- Need for filtering the view of injuries by categorizing the person type such as (driver vs pedestrian) to assess the level of risk at different road levels.
- Need for a clean report of summaries of medical outcomes for supporting an evidence-based trauma research paper.

Type of software she uses:

- Statistical Analysis Software for analysing large datasets.
- Database Management for basic proficiency in SQL to query out specific data points.
- Data Visualization tools such as Tableau or Power BI for turning raw crash data into visual maps and trauma heatmaps.

Pain Points:

- Data is often too messy
- No alignment of data link with accident type or clearly with injury outcome.
- Disconnected Data, information regarding critical medical info and road logs are kept in separate files, due to which it's hard to see how crashes can cause serious injuries.
- No proper close calls, as the database only tracks actual incidents, therefore it ignores the near misses, leading to the missing of close calls.

Skills:

- **Great at analysing patterns in large sets of crashes and injuries.**
- **Have skills in statistical modelling and predicting different factors after the crash and survival.**
- **Has a professional skill of using technical things like SQL, SPSS and Data Visualization Tools.**

Type of image: The image is generated with help of an AI tool: Copilot. The image does not exist anywhere and is completely okay to be used as for trauma research analyst for my persona.

Wireframe Diagram for Level 1:

Explanation:

This diagram of wireframe UI provides the simple and clear version of a blueprint visual for the mission statement page, highlighting how information's flows from the main mission header towards the site's key sections. The wireframe diagram begins with the mission statement at the top, which is followed by the UCD section that illustrate how our website supports our users. It has four UCD principles, which are displayed as smaller linked cards. The diagram highlights a clean, logical structure which allows our users to easily and smoothly understand it through our page. **(Department of Transport and Planning 2026).**

Level 2: Explore crash conditions (Student A)

Page name: Explore Conditions

Student: Student A

User group: Local council road safety officer

Focus: Road surface, weather, lighting, and environmental crash patterns

PURPOSE

The Explore Conditions page helps local council road safety officers compare environmental crash conditions across Victoria. Users can explore crash data related to road surface, weather and lighting conditions to identify possible high risk situations and support road safety planning.

Wireframe Diagram of Level 2 Explore crash conditions

USER GOALS

- identify environmental crash patterns
- compare crash conditions
- support infrastructure planning decisions
- identify high risk road conditions

DATABASE FEATURES

- filtering crash conditions
- grouping crash records
- sorting crash counts
- displaying summarised crash data

NIELSEN HEURISTICS [5]

- Visibility of system status through updated summaries and charts
- Recognition rather than recall using dropdown filter selections
- Consistency and standards through repeated page layout and navigation
- Aesthetic and minimalist design through simple summaries and charts

DESIGN PATTERNS

- Dashboard pattern for crash summaries
- Filter and refine pattern for condition selection
- Data table pattern for comparing crash information
- Card layout pattern for displaying key statistics

HOW THE DESIGN SUPPORTS THE PERSONA

The page supports Maya Thompson by helping her quickly identify crash trends linked to environmental conditions without manually analysing large crash datasets. Filters, charts and summary cards make crash information easier to compare and understand.

Level 2: (Student B)

Sub Task B: Focused view of people and Injuries Sustained.

Explanation of what I am trying to achieve:

The specific task designed for Dr. Sarah Chen is a 'Human-Factor Survival Audit,' where she uses the interface to correlate ejection status with fatality counts to support her goal of clinical research.

Level 2 User Interface Wireframe:

Explanation:

The wireframe diagram clearly highlights the injury outcome summary database. It further illustrates the human factor survival audit task for Dr Sarah Chen, which showcases the interactive filters that will help her to view the aggregated summary table. This direct link between data logic and interface design helps to ensure an intuitive, efficient research workflow that also helps to handle data anomalies transparently, and ensure that they are represented in summary rather than hiding them, which further maintains the integrity of the audit.(Department of Transport and Planning 2026)

Final Aggregated data summary table :

	A	B	C	D	E	F
1	Person Type	Injury Level	Total People	Ejected Status (filter applied)	Taken to Hospital	
2	Driver	Fatal	120	Not ejected	Yes	
3	Driver	Serious Injury	450	Not ejected	Yes	
4	Passenger	Fatal	35	Ejected	Yes	
5	[Unknown]	[Other]	12	Unknown	No	

(Department of Transport and Planning 2026)

Database Logic for this.

The following logic could be implemented to transform raw data into summarized data for " Focused View of People and Injuries ".

1. For this first, we will select and join the data. The system will select the data from the records of the person table, such as injury levels and ejection status, and then join it with the accident table by using

accident_number as the primary and foreign key, which allows us to link specific outcomes of humans to events related to the crash.

2. By filtering interactive UI elements, the dropdowns, this will allow our users to apply the filters, especially for my user, Dr Sarah Chen. She can easily filter it by applying "Person Type," such as driver, pedestrian, cyclist, etc., and ejection status, such as whether it is ejected or not ejected, which helps to reduce the noise in the dataset.
3. Through using the count () function, we can aggregate the data, which, instead of showing numerous thousands of individual rows, allows the system to calculate the total number of each unique combination of person type and the injury level type.
4. Now, as for the final summary table, we will sort it by the " Total counts " in descending order, which will allow us to ensure that the most frequent, often, and dangerous injury outcomes are displayed at the top for immediate action or response.
5. As for handling data anomalies and to make sure that the data remains unbiased and accurate. We can group the missing data or rows with unknown or null values in critical fields like injury levels into other or unknow category rather than deleting it and making sure the total scale of data is preserved and is not lost. Furthermore, our system will prioritize the highest recorded injury severity. For instance, if an accident record has conflicting injury data, the system will display the most severe outcome to ensure the risk to people is not understated. This keeps the data **accurate and reliable** for research **(Department of Transport and Planning 2026)**.

Level 3: Condition Deep Analysis page (Student A)

Page name: Deep Analysis

Student: Student A

User group: Local council road safety officer

Focus: Deeper environmental crash patterns and condition relationships

PURPOSE

The Deep Analysis page helps local council road safety officers investigate deeper environmental crash patterns by exploring relationships between multiple crash conditions. This page supports more advanced analysis by using the result of one query as the input for another query.

Wireframe Diagram of Level 3 Deep Analysis

USER GOALS

- investigate deeper crash relationships
- identify high risk environmental combinations
- support road safety planning decisions
- understand linked crash conditions

DATABASE FEATURES

- using one query result as the input for another query
- grouping crash combinations
- sorting crash counts
- displaying deeper crash analysis

NIELSEN HEURISTICS [5]

- Visibility of system status through updated analysis results
- Recognition rather than recall using dropdown analysis selection
- Consistency and standards through repeated layout and navigation
- Aesthetic and minimalist design by focusing only on relevant crash relationships

DESIGN PATTERNS

- Progressive disclosure pattern for deeper analysis
- Dashboard pattern for charts and summaries
- Interactive filtering pattern for crash condition analysis
- Data table pattern for crash comparison results

ACCESSIBILITY CONSIDERATIONS

Accessibility considerations were included to improve usability for a wider range of users. High contrast colours were used to improve readability, while clear headings support screen reader navigation and dropdown filters and buttons were also designed with clear labels to support easier navigation for users with different accessibility needs. These design choices help make the interface easier to navigate and understand for users with different accessibility needs [6].

HOW THE DESIGN SUPPORTS THE PERSONA

The page supports Maya Thompson by helping her investigate deeper environmental crash relationships that may contribute to higher crash frequencies. The page allows users to identify linked crash conditions more efficiently and supports evidence based road safety planning.

LEVEL 3 REQUIREMENT

This design satisfies the Level 3 requirement because the result of the first query becomes the input for the second query. For example, the system first identifies the atmospheric condition linked to the highest crash count, then uses that condition to analyse related road surface and lighting crash patterns.

Level 3: (Student B)

Advanced Association with Risk of Mortality

Task Design: Mapping Ejection to Fatality Probability

Our website will have a "Cross-Factor Discovery Tool" which will help assist Dr. Sarah Chen in her search for significant vehicle safety failures. This task will further allow our user to select a specific variable such as "Ejection Status" and correlate that against "Hospitalisation Rates" and "Fatal Injury Outcomes" to create a new statistical metric, the Survival Probability Index.

Discovery of New Facts: By interacting with these tasks, Dr. Chen can also discover critical insights that are not visible in basic tables, such as:

- **The Ejection Penalty:** Discovering that ejected occupants have a significantly higher mortality rate even when medical intervention (hospitalisation) is immediate, compared to those contained within the vehicle.
- **Vulnerable Occupant Profiles:** Identifying if specific "Person Types" (e.g., rear-seat passengers) show higher hospitalisation-to-fatality ratios, revealing hidden weaknesses in rear-cabin safety engineering

Supporting Persona Goals:

- Transform raw number into actionable evidence
- Allow our users to see data-backed discovery.
- Efficient and more effective to reduce mortality to hospitalization gap in high-speed crashes.

(Department of Transport and Planning 2026).

Wireframe for level 3:

The Wireframe of level 3 highlights how the cross-factors discovery tool allows users to correlate variables like ejection status with mortality rates and helps to generate a survival probability index. This allows the interface to identify critical insights, such as ejection penalty, and allows vulnerable occupant profiles to transform raw crash data into actionable evidence, allowing further improvement of vehicle safety. (Department of Transport and Planning 2026).

Conclusion:

Our project developed a tiered framework that allow us to transform Victorian road crash data (Department of Transport and Planning 2026) into actionable safety evidence. Therefore, by correlating variables like ejection status and mortality rates, the "Cross-Factor Discovery Tool" identifies engineering weaknesses to bridge the gap between hospitalization and survival

Appendix: Project Log

Date	Team Member	Contribution / Task Completed	Time Spent (hrs)	Related Deliverable
24/04/2026	Aisha	the team charter/ Completed	1h	Team charter document completed.
24/04/2026	Tayyab	The team charted /completed	1h, 10mins	Revised the team charted template, read throughout and fixed the few answers, that required more detail.
04/05/2026	Aisha	Drew a draft for Level 1 landing page and later recreated it digitally on Word.	4hrs	Level 1 Landing page draft completed.
05/05/2026	Tayyab	Level 1	4hrs, 50mins	Completed mission page statement , made a draft of persona on word doc, made sure info is stored in database and easily be retrieved.
05/05/2026	Aisha	Researched Victorian road safety information and looked into how councils use crash data	3hrs	Secondary user research
06/05/2026	Aisha	Developed the user persona and write the key user group section for Student A	2hrs	Persona (Maya Thompson) and user group section
06/05/2026	Aisha	Designed the Level 2 Explore Conditions page and wrote the explanation for the layout and features	4hrs	Level 2 page design
06/05/2026	Tayyab	Done with research of Victorian crash road incidents	3hrs	Secondary user research
07/05/2026	Aisha	Added Nielsen heuristics and design patterns for the Level 2 page	2hrs	Level 2 usability section
07/05/2026	Tayyab	Done with the development of users persona, and identifying and writing key user group section for Student B	4hrs	Persona and key users
08/05/2026	Tayyab	Developed step by step logic which is required for transforming of raw person	2hrs	Drafted SQL database logic

		data into a summarized format		
09/05/2026	Tayyab	Created UI wireframe for the summary page and designed the feature for dropdown filters for person type and ejection status for improving user efficiency	4hrs	Wireframe creation (Level 2)
10/05/2026	Aisha	Designed the Level 3 Deep Analysis page and created the wireframe layout	4hrs	Level 3 page
10/05/2026	Tayyab	Drafted strategy for handling missing and unknown data in dataset to ensure everything remains unbiased and technically accurate	3hrs	Done and developed strategy for data handling.
10/05/2026	Aisha	Completed the Level 3 explanation, Nielsen heuristics and design patterns	3hrs	Level 3 usability section
11/05/2026	Aisha	Started working on Conduct Secondary User Research and gathered sources to use.	2hrs	Conduct Secondary User Research
13/05/2026	Aisha / Tayyab	Team meeting	30mins	As per the teacher has advised, we have decided to work on our own tasks individually.
13/05/2026	Aisha	Final touches and Finalized my Persona Maya	1hr	Persona Completed
13/05/2026	Aisha	Secondary User research	2hrs	Final draft completed
13/05/2026	Tayyab	Designed specific user task for level 3 and completed level 3	6hrs	Designed a task for our specific user that produces new data which is related to the people when considering factors such as person was ejected, taken to hospital, injury, also made user wireframe that clearly highlights this out.
15/05/2026	Aisha	Redesigned all my wireframe diagrams on Miro	2hrs	Completed.
16/05/2026	Aisha	Final touches to the final report	3hrs	Completed and Submitted
